Aerodynamics, from Greek ἀήρ aer (air) + δυναμική (dynamics), is the study of motion of air, particularly as interaction with a solid object, such as an airplane wing. It is a sub-field of fluid dynamics and gas dynamics, and many aspects of aerodynamics theory are common to these fields. The term aerodynamics is often used synonymously with gas dynamics, the difference being that ...

In materials science, fatigue is the weakening of a material caused by repeatedly applied loads. It is the progressive and localized structural damage that occurs when a material is subjected to cyclic loading. The nominal maximum stress values that cause such damage may be much less than the strength of the material typically quoted as the ultimate tensile stress limit, or the yield stress limit.

(ii) aeroplasticity -or, to use more simple language: the plane changes shape during flight. This is especially a problem for paper aeroplanes like the dart. During the launch phase of the flight, aerodynamic forces will tend to push the fuselage together all the way along the plane; however, as the paper aeroplane starts to slow down, the fuselage will come apart in a V shape at the back.
